# Introduction

This document provides information about the management information bases (MIBs) available for the device, including public and private MIBs.

This document also provides information about the notifications available for the device, including standard notifications and private notifications.

## Important information

### About MIB support status

A MIB, table, or scalar object is commented as "Not supported" if it is not supported by the device. To avoid unknown issues, do not access such a MIB, table, or scalar object even if it is accessible.

If a MIB is not supported, its notifications are not supported as well.

For backward compatibility and interoperability with third-party vendors, the software release might contain deprecated or obsolete MIBs. This document lists these MIBs but does not provide detailed information about the MIBs.

### About configuring the device by setting MIB objects

You can configure the device by setting its supported MIB objects. To make sure the values set in MIB objects can be restored correctly in CLI, use the following restrictions and guidelines:

- As a best practice, use visible characters from 0x21 to 0x7E, except for 0x3F, which represents the question mark (?). If you want to use a special character, make sure the CLI supports that character. For example, CLI uses the space for delimitation and uses the question mark for help indication. If a value contains a space or question mark, the CLI might be unable to restore that value.
- Make sure the value set in the MIB object is in the value range supported in the CLI. In rare situations, an MIB object might support a different value range than the CLI. For example, an OCTET STRING type MIB object might support longer strings than the maximum length allowed in the CLI. If the value set in the MIB object exceeds the maximum length allowed in the CLI, the CLI will be unable to restore the value correctly. Conversely, if a value set in the CLI is beyond the value range for the MIB object, the system cannot set that value in the MIB object.

## Using this document

This document describes MIBs in alphabetical order.

Information about scalar and tabular MIB objects is presented in tabular form, as shown in the following example:

| Object (OID)                  | Access    | PDS | Description |
|-------------------------------|-----------|-----|-------------|
| ifIndex (1.3.6.1.2.1.2.2.1.1) | read-only | Yes | As per MIB  |

Table 1 describes the purpose of each column.

**Table 1 Table field description**

| Item         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## List of public MIBs

In this section, all public MIBs supported by platform are listed.

Any action to modify, delete, remove and add must be recorded in Revision History.

In File name column, the MIB file name must follow by the naming rule, which is the MIB module name prefixed with the RFC index like rfc2737-entity.mib. Note that file name is lowercase.

In MIB Version column, it indicates the MIB version used in devices.

## pingCtlTable

OID of this table is: 1.3.6.1.2.1.80.1.2

1.1 The parameter which is not supported by the corresponding pingCtlType cannot be configured.

1.2 When creating a test entry, the default value of pingCtlType is pingIcmpEcho. Once created, pingCtlType cannot be changed, so pingCtlType must be set as the entry created.

1.3 When creating an entry, if the parameter which is not supported by the corresponding pingCtlType is set, the operation will be failed.

1.4 Any of the configurations in pingCtlTable changed, the corresponding results, histories and statistics will be cleared, except the following objects:

pingCtlTrapGeneration,

pingCtlTrapProbeFailureFilter,

pingCtlTrapTestFailureFilter,

pingCtlDescr,

pingCtlMaxRows(If the value of this object is smaller than the previous value, the redundant histories records will be deleted.)

The results, histories and statistics must be the factual reflection of the test results of current configurations.

Users will be puzzled when they get the results which caused by the previous configurations.

1.5 pingCtlTargetAddressType and pingCtlTargetAddress must be modified together.

1.6 pingCtlSourceAddressType and pingCtlSourceAddress must be modified together.

1.7 If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.

The following objects are supported by all pingCtlTypes:

pingCtlOwnerIndex, pingCtlTestName, pingCtlTimeOut,

pingCtlAdminStatus, pingCtlFrequency,

pingCtlStorageType, pingCtlTrapGeneration, pingCtlType, pingCtlDescr, pingCtlRowStatus

The remainder objects is supported by part of pingCtlTypes.

The relationship between these objects and corresponding pingCtlType are described in the following table:

| Value of pingCtlType                             | Support parameters                                                                                                                                                                                                                                                                                                |

## ENTITY-MIB

This MIB is supported only when the products support RFC4133.

This chapter describes the information of Entity MIB. The Entity MIB contains five groups of MIB objects: entityPhysical group, entityLogical group, entityMapping group, entityGeneral group and entityNotifications group. Thereinto, the entityPhysical group describes the physical entities managed by a single agent. This group contains a single table to identify physical system components, called the entPhysicalTable. The entPhysicalTable contains one row per physical entity, and must always contain at least one row for an "overall" physical entity, which should have an entPhysicalClass value of 'stack(11)', 'chassis(3)' or 'module(9)'. Each row is indexed by an arbitrary, small integer, and contains a description and type of the physical entity. It also optionally contains the index number of another entPhysicalEntry indicating a containment relationship between the two.

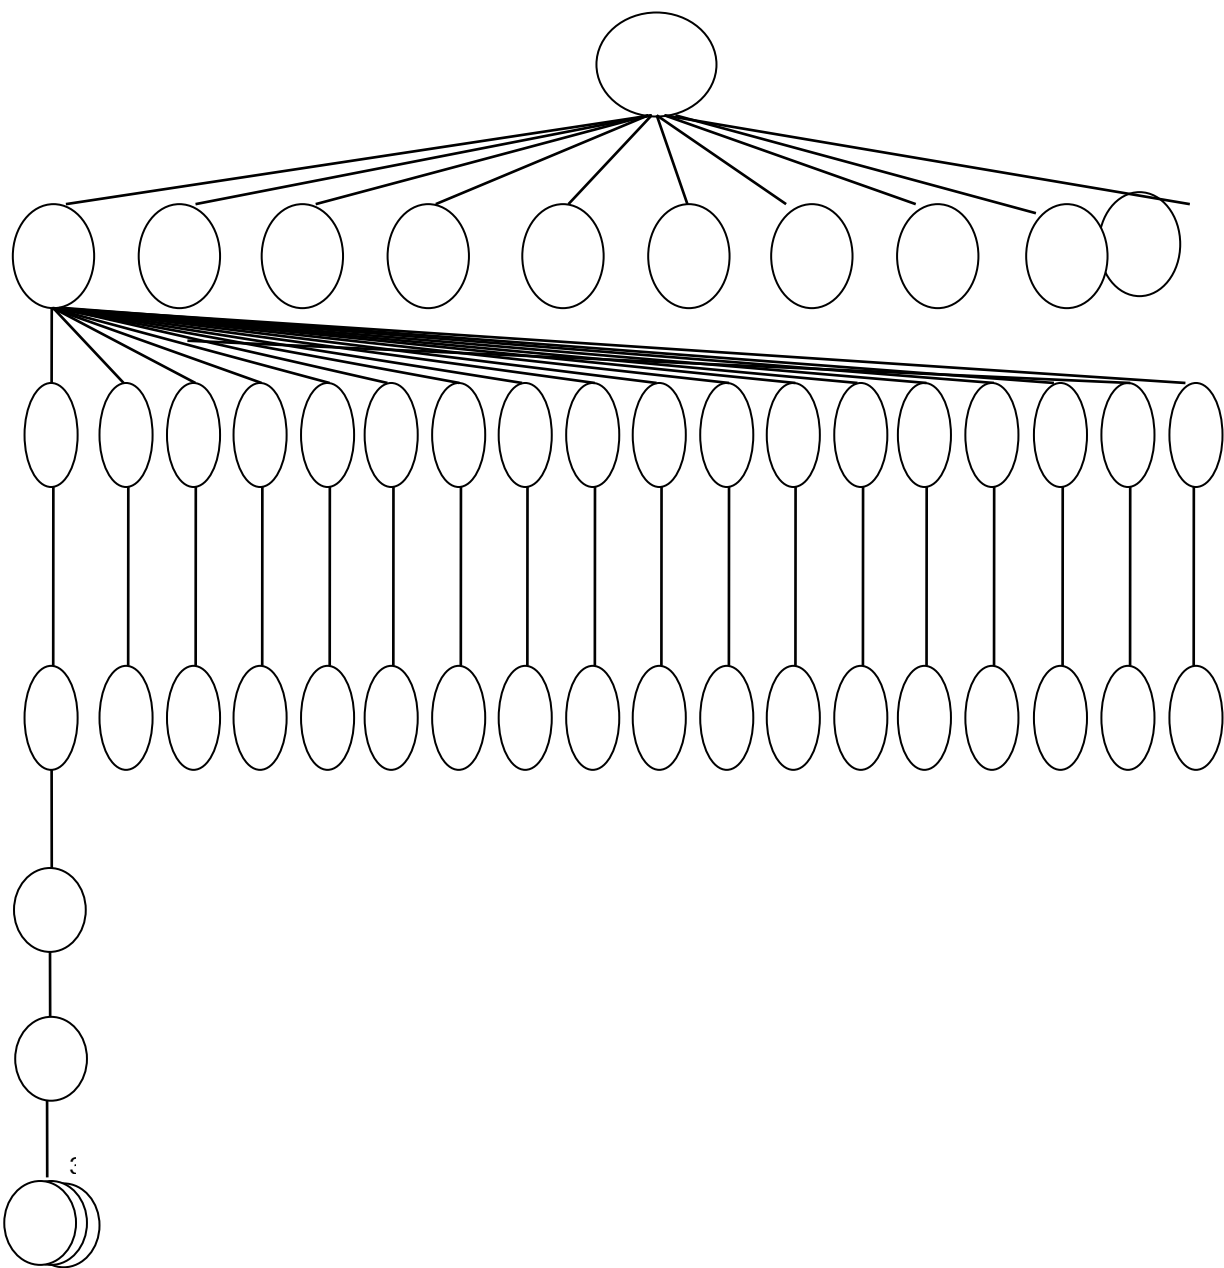

The entityLogical group describes the logical entities managed by a single agent. This group contains a single table to identify logical entities, called the entLogicalTable. The entLogicalTable contains one row per logical entity. Each row is indexed by an arbitrary, small integer and contains a name, description, and type of the logical entity. It also contains information to allow access to the MIB information for the logical entity. This includes SNMP versions that use a community name (with some form of implied context representation) and SNMP versions that use the SNMP ARCH [RFC2571] method of context identification. If a agent represents multiple logical entities with this MIB, then this group must be implemented for all logical entities known to the agent. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this group may be omitted by the agent.

The entityMapping group describes the associations between the physical entities logical entities, interfaces, and non-interface ports managed by a single agent. This group contains three tables to identify associations between different system components. The entLPMappingTable contains mappings between entLogicalIndex values (logical entities) and entPhysicalIndex values (the physical components supporting that entity). A logical entity can map to more than one physical component, and more than one logical entity can map to (share) the same physical component. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entAliasMappingTable contains mappings between entLogicalIndex, entPhysicalIndex pairs and 'alias' object identifier values. This allows resources managed with other MIBs (e.g., repeater ports, bridge ports, physical and logical interfaces) to be identified in the physical entity hierarchy. Note that each alias identifier is only relevant in a particular naming scope. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entPhysicalContainsTable contains simple mappings between 'entPhysicalContainedIn' values for each container/'containee' relationship in the managed system. The indexing of this table allows an NMS to quickly discover the 'entPhysicalIndex' values for all children of a given physical entity.

The entityGeneral group describes general system attributes shared by potentially all types of entities managed by a single agent. This group contains general information relating to the other object groups. At this time, the entGeneral group contains a single scalar object (entLastChangeTime), which represents the value of sysUptime when any part of the Entity MIB configuration last changed.

The entityNotifications group contains status indication notifications. This group contains notification definitions relating to the overall status of the Entity MIB instantiation.

The following table shows the index range of each physical class of each stack in S5130EI products. It supports 10 units in a stack at max. To compatible with old products, there are 1 slot, 1~2 PSU, 0~1 RPS, 1~2 Fans and 1~4 Sensors as level 1 containers, and 6 sub slots as level 2 containers in one unit. There are front panel sub slot, stacking ports sub slot, expansion card sub slots, USB sub slot. The max port number in a sub slot is 64, which are 48 fixed ports, 4 fixed SFP+ ports, some modules support pluggable 2 QSFP+ ports. It also support 1 out-band management port. Such as the figure and the table shown:

## IGMP-STD-MIB

Not support.

The IGMP-STD-MIB contains two tables:

- (1) the IGMP Interface Table which contains one row for each interface on which IGMP is enabled, and
- (2) the IGMP Cache Table which contains one row for each IP multicast group for which there are members on a particular interface.

Both tables are intended to be implemented by hosts and routers, but some columnar objects in each table apply only to routers.

## RMON2-MIB

The RMON2-MIB is used with network management protocols in TCP/IP-based internets. In particular, it defines objects for managing remote network monitoring devices.

## The allocation algorithm of snmpEngineID

The snmpEngineID has a length of 16 octets:

The first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA), and the very first

bit is set to 1. For example, if H3C Networks has been assigned enterprises 25506, the first four octets would be assigned '800063A2'H.

For routers, the remaining eight octets are random octets.

For switches, the fifth octet is 8 indicates that the following is enterprise-specified. The following six octets are the MAC address. The remaining four octets are the MDC number.

## The algorithm of snmpEngineBoots

If SNMP becomes enabled from disabled, then the snmpEngineBoots increments 1.

If the snmpEngineID has been configured and its value differs from the former one, then the snmpEngineBoots is reverted to 1.

If the snmpEngineTime reaches its maximum value then the snmpEngineBoots increments 1.

## SNMP-TARGET-MIB

snmpTargetAddrTable and snmpTargetParamsTable combined are used to create a valid target host row in device. The command line corresponding to this entry can be displayed as “snmp-agent target-host trap address udp-domain ...”. There are some rules need conformed with.

For a valid target host entry which is made up of one entry in snmpTargetAddrTable and another entry in snmpTargetParamsTable:

- 1) The value of snmpTargetAddrName is the same as the value of snmpTargetAddrParams.
- 2) The value of snmpTargetAddrParams is the same as the value of snmpTargetParamsName.
- 3) The value format of snmpTargetAddrName is something like “traphost.” + snmpTargetParamsSecurityName + IpAddress+ VPN Instance name. The IpAddress is the ip address part of snmpTargetAddrTAddress. If not support VPN, VPN Instance name does not need to be configured.
- 4) The value of snmpTargetAddrTagList must be octet string “TrapHost”.
- 5) For IPV4, the value of snmpTargetAddrTDomain must be snmpUDPDDomain.
- 6) The value of snmpTargetAddrStorageType should be nonVolatile.

- 7) The length of snmpTargetParamsSecurityName in snmpTargetAddrParams restricted in 1 to 32 octets.
- 8) The length of VPN Instance name in snmpTargetAddrParams restricted in 1 to 31 octets.

## hh3cAcIIPAcIAdvancedTable

OID of this table is :1.3.6.1.4.1.25506.2.8.2.2.3

Notes:

If a rule will be created, hh3cAcIIPAcIAdvancedRowStatus must be 4 and the rule number does not exist.

When the value of hh3cAcIIPAcIAdvancedProtocol is udp or tcp, hh3cAcIIPAcIAdvancedSrcOp, hh3cAcIIPAcIAdvancedSrcPort1 and hh3cAcIIPAcIAdvancedSrcPort2 can be set;

The value of hh3cAcIIPAcIAdvancedDestAddrType and hh3cAcIIPAcIAdvancedSrcAddrType is 1 or 2.

When the value of hh3cAcIIPAcIAdvancedProtocol is ICMP or ICMPV6, hh3cAcIIPAcIAdvancedIcmpType and hh3cAcIIPAcIAdvancedIcmpCode can be set, otherwise it can not.

If the node hh3cAcIIPAcIAdvancedSrcAny is set and the value of hh3cAcIIPAcIAdvancedSrcAny is true, the set operation of hh3cAcIIPAcIAdvancedSrcAddrType, hh3cAcIIPAcIAdvancedSrcAddr, hh3cAcIIPAcIAdvancedSrcPrefix, or hh3cAcIIPAcIAdvancedSrcWild does not be executed. when the node hh3cAcIIPAcIAdvancedSrcAny is not set, If the node hh3cAcIIPAcIAdvancedSrcAddrType is set and the value of hh3cAcIIPAcIAdvancedSrcAddrType is 1, hh3cAcIIPAcIAdvancedSrcAddr and hh3cAcIIPAcIAdvancedSrcWild must be set correctly and the set operation of node hh3cAcIIPAcIAdvancedSrcPrefix is forbidden; If the node hh3cAcIIPAcIAdvancedSrcAddrType is set and the value of hh3cAcIIPAcIAdvancedSrcAddrType is 2, hh3cAcIIPAcIAdvancedSrcAddr and hh3cAcIIPAcIAdvancedSrcPrefix must be set correctly and the set operation of node

hh3cAcIIPAcIAdvancedSrcWild is forbidden. The value of hh3cAcIIPAcIAdvancedSrcAddrType is 1 or 2 now. So do hh3cAcIIPAcIAdvancedDestAddrType, hh3cAcIIPAcIAdvancedDestAddr, hh3cAcIIPAcIAdvancedDestPrefix, hh3cAcIIPAcIAdvancedDestAny and hh3cAcIIPAcIAdvancedDestWild.

The value of hh3cAcIIPAcIAdvancedFragmentFlag is only 0 or 2 now.

All the objects in the table except hh3cAcIIPAcIAdvancedComment can not be modified now.

If destroy operation is executed, hh3cAcIIPAcIAdvancedRowStatus value must be 6.

## hh3cCBQoSClassifierCfgInfoTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.2.1.1.2

This table does not support to modify the variable of existing entry, only supports to create a new entry and destroy an existing entry.

When creating a new entry of this table:

- (1) Get the value of hh3cCBQoSClassifierIndexNext.
- (2) Use the value as hh3cCBQoSClassifierIndex to create the new entry of this table.
- (3) hh3cCBQoSClassifierName must be bound when creating a new entry of this table.
- (4) hh3cCBQoSClassifierRuleCount stands for the number of nodes in the classifier, including the nodes that are only supported by the command line.

## hh3cCBQoSMatchRuleCfgInfoTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.2.1.1.3

This table does not support to modify the variable of existing entry, only supports to create a new entry and destroy an existing entry.

When creating a new entry of this table:

(1) Get the value of hh3cCBQoSClassifierMatchRuleNextIndex from table hh3cCBQoSClassifierCfgInfoTable

(2) Use the value as hh3cCBQoSMatchRuleIndex to create the new entry of this table.

(3) If hh3cCBQoSMatchRuleIfNot is not bound when creating a new entry of this table, the value 'match' will be given by the system as default.

(4) hh3cCBQoSMatchRuleType must be bound when creating a new entry of this table.

(5) If the hh3cCBQoSMatchRuleType is matchRuleAny(1), matchRuleIPv4Protocol(4), matchRuleIPv6Protocol(5):hh3cCBQoSMatchRuleStringValue, hh3cCBQoSMatchRuleIntValue1 and hh3cCBQoSMatchRuleIntValue2 must not be bound.

(6) If the hh3cCBQoSMatchRuleType is matchRuleIPv4Acl(2), matchRuleIPv6Acl(3): one of hh3cCBQoSMatchRuleStringValue and hh3cCBQoSMatchRuleIntValue1 must be bound ,hh3cCBQoSMatchRuleIntValue2 must not be bound.

(7) If the hh3cCBQoSMatchRuleType is matchRuleIpPre(8), matchRuleVlan8021p(9), matchRuleQosLocalID(15), matchRuleLocalPrecedence(22), matchRuleServiceDot1p(25),: hh3cCBQoSMatchRuleIntValue1 must be bound, hh3cCBQoSMatchRuleIntValue2 and hh3cCBQoSMatchRuleStringValue must not be bound.

(8) If the hh3cCBQoSMatchRuleType is matchRuleDscp(7): only hh3cCBQoSMatchRuleIntValue1 and hh3cCBQoSMatchRuleIntValue2 can be bound, hh3cCBQoSMatchRuleStringValue must not be bound.

(9) If the hh3cCBQoSMatchRuleType is matchRuleSourceMac(13), matchRuleDestinationMac(14),matchRuleClassifier(16),matchRuleInboundInterface(17),

matchRuleVlanID(20), matchRuleTopMostVlanID(21), matchRuleMplsLabel(26), matchRuleSecondMplsLabel(27): hh3cCBQoSMatchRuleStringValue must be bound, hh3cCBQoSMatchRuleIntValue1 and hh3cCBQoSMatchRuleIntValue2 must not be bound.

(10) The type matchRuleIPXProtocol(6), matchRuleAtmClp(11), matchRuleFrDe(12) and matchRuleSourceIp(19) are not supported.

## HH3C-CONFIG-MAN-MIB

A configuration management MIB, includes configuration log management and Backup & Restore operation of configuration.

All the configuration change events can be managed by the log management MIB. The configuration may be changed by CLI, SNMP or other ways defined as the MIB.

Backup & Restore MIB group provides the configuration backup and restore among flash, memory and network.

Note: Writing flash can be done by backup(save) as described in figure below.

## Relationship between entity and extend property

The relationship between entity and extend property for S5130EI products is listed below. In these tables, stack stands for fabric, chassis stands for unit, and container stands for slot or sub-slot, module stands for board or sub-card.

| entity      | hh3cEntityExtAdminStatus (R/W) |
|-------------|--------------------------------|
| chassis     | No                             |

### hh3clfQoSLRConfigTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.1.3.1

In the set operation, hh3clfQoSLRCir, hh3clfQoSLRCbs should be set following the range. Get the range using the table hh3cQoS CapabilityTable.

hh3clfQoSLRCir must be bound in a set operation. If hh3clfQoSLRCbs is not bound in the set operation, the value will be given by the system.

## hh3clfQoS QSWeighTTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.1.1.1.2

The set operation of this table only supports multiple variable bindings.

If the system supports hh3clfQoSQueueGroupType, variables that must be bound in a set operation include hh3clfQoSQueueGroupType, or hh3clfQoSQueueGroupType must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group0(1), hh3clfQoS QSType and hh3clfQoS QSValue must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group1(2) or group2(3), hh3clfQoS QSType and hh3clfQoS QSValue must be bound in the set operation.

If the system does not support hh3clfQoSQueueGroupType, hh3clfQoSQueueGroupType must not be bound in the set operation. And variables that must be bound in the set operation include hh3clfQoS QSType and hh3clfQoS QSValue.

If the hh3clfQoS QSMInBandwidth is set, the hh3clfQoS QSMODE must be wfq mode.

1.hh3cdot1qVlanMIBTable is used for VLAN information management and monitor, It can be used for VLAN row creation, deletion, and VLAN property configuration and query.

In this table the leaf node can be classified as configure node and query node, configure node can both be used for configure and query purposes, while query node can be used for query only.

The configure nodes in this table include:

hh3cdot1qVlanName

hh3cdot1qVlanPorts  
hh3cdot1qVlanType  
hh3cdot1qVlanPriority  
hh3cdot1qVlanRowStatus  
hh3cdot1qVlanBroadcastSuppression  
hh3cdot1qVlanBcastSuppressionPPS  
hh3cdot1qVlanMulticast (Not support)

Rest of the leaf nodes are query nodes.

2.hh3cdot1qVlanMIBTable configuration instruction:

hh3cdot1qVlanMIBTable use VLAN Index as the table index, which is normally called VLANID,

If a row is to be created, it is recommended to traverse this table first and use the unused VLAN index to create the row. In this table rowstatus only support active(1), createAndGo(4), destroy(6).

For this MIB, there are two kinds of operation:

2.1 hh3cdot1qVlanRowStatus(createAndGo(4)) and nodes are set together

When the rowstatus node and the following nodes are set simultaneously

hh3cdot1qVlanName  
hh3cdot1qVlanPorts  
hh3cdot1qVlanType  
hh3cdot1qVlanPriority  
hh3cdot1qVlanBroadcastSuppression  
hh3cdot1qVlanBcastSuppressionPPS  
hh3cdot1qVlanMulticast (Not support)

For hh3cdot1qVlanName, VLAN name string check is performed, the row is created only if the string check succeeds.

For rest of the leaf nodes listed above, the row will be created before setting the properties. If errors happen when setting the properties, the operation will fail while the row has already been created.

Here are some examples for the error mentioned above:

1) hh3cdot1qPorts: through this MIB node only access type ports can be added or deleted. Operation will fail while the row has already been created, if some of the ports to be added or deleted are not of access type.

2) hh3cdot1qVlanType: with value sub-vlan(3) cannot be set using this MIB, when rowstatus(createAndGo(4)) and hh3cdot1qVlanType(sub-vlan(3)) are set together, Operation will fail while the row has already been created.

It is recommended to set hh3cdot1qVlanRowStatus(createAndGo(4)) and other node properties separately to avoid such kind of error.

2.2 Row already exist and set node properties:

For the following nodes:

hh3cdot1qVlanName     The name length cannot exceed 32 characters.

hh3cdot1qVlanPorts To set the node successfully you should first get the value of the node, and then only change the corresponding bit of the access port.

hh3cdot1qVlanType sub-vlan(3) secondary-vlan(5) cannot be set using this MIB

hh3cdot1qVlanPriority

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

### 3. configuration example

#### 1) Configuration success

hh3cdot1qVlanRowStatus(createAndGo(4)) are set together with hh3cdot1qVlanName using value "vlantest", use the index unused in this table, the row is created and hh3cdot1qVlanName is set successfully.

#### 2) Configuration fail

Precondition: there is trunk type port existing on the device and port not belongs to this vlan. hh3cdot1qVlanRowStatus(createAndGo(4)) and hh3cdot1qVlanPorts with trunk port corresponding bit in the octet string setting to 1 are set together, Operation will fail while the row has already been created.

## scalar objects for notify

When the cached number of MAC address information has reached the value specified by hh3cMACInformationCacheLen but the amount of time elapsed since the previous notification is not greater than the interval value specified by hh3cMACInformationcSendInterval, the device overwrites the last piece of information written into the cache queue with the new MAC address change. The trap is generated and sent to the remote monitoring device when the amount of time elapsed since the previous notification is greater than the interval value specified by hh3cMACInformationcSendInterval and at least one cached MAC address information learnt or removed.

## hh3cNqaCtlTable

OID of this table is: 1.3.6.1.4.1.25506.8.3.1.2

- a) The parameter which is not supported by the corresponding pingCtlType cannot be configured.
- b) Once the configuration is modified, the result, histories, and statistics of the corresponding entry will be cleared.
- c) The results, histories and statistics must be the factual reflection of the test results of current configurations.
- d) Users will be puzzled when they get the results which caused by the previous configurations.
- e) If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.
- f) The following table shows the relationship between pingCtlType and parameters.

# HH3C-RMON-EXT2-MIB

The HH3C-RMON-EXT2-MIB is used with network management protocols in TCP/IP-based internets. In particular, it defines objects for managing remote network monitoring devices.

## hh3cRmonExtAlarmTable

Note:

1) When creating a new instance of this table, the following objects SHOULD be set simultaneously: hh3cRmonExtAlarmVariable, hh3cRmonExtAlarmSympol, hh3cRmonExtAlarmStatus.

2) Configuring will be failed, if the length of command string build from current configuration is greater than max length of CLI.

OID of this table is: 1.3.6.1.4.1.25506.2.125.1

When this function is enabled, if the image version of the new device is different from that of the master, the image of the new device will be updated to be consistent with that of the master. When this function is disabled, the new device can not join the stack if the image version of the new device is different from that of the master. |

#### ✧ Terms

(The terms listed below are just used in the range of this section.)

BootRom: a special program which is used to boot the system on system startup.

BOOT ROM: a specific zone in system in which a BootRom is stored.

Bootrom file: a file which exists in file system. The content of such file is BootRom.

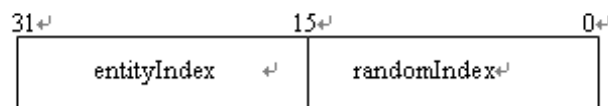

#### ✧ Function

The responsibility of this table is to update BootRom from a BootRom file in file system to BOOT ROM.

It assumes that the source Bootrom file already exists in the file system of the device before doing operation. On system startup, this table is empty.

#### ✧ Notes

- 1) Be careful that the operation on BOOT ROM updating is risky. Other operations may halt during updating BOOT ROM. Such operation may take a long time as well.
- 2) The value of hh3cSysCurUpdateBtmFileName will not be updated until updating operation completed.
- 3) The value of hh3cSysBtmLoadIndex is divided into two parts as follows:

The entityIndex is the same as entPhysicalIndex as defined in the entPhysicalTable, and must be the entPhysicalIndex of the entity whose entPhysicalClass is 'module'. The randomIndex is determined by users. Algorithm of hh3cSysBtmLoadIndex:

$hh3cSysBtmLoadIndex = (entityIndex \ll 16) \mid randomIndex$

4) It is strongly recommended that the name of a Bootrom file ends with valid filename extension, but this table will not check the filename. The verification of validity of a Bootrom file will be performed after the hh3cSysBtmRowStatus of this instance turns into 'active'.

5) hh3cSysBtmFileName must include a path.

6) At present, hh3cSysBtmFileType must be set to 'main'.

7) All necessary objects, which are hh3cSysBtmFileName and hh3cSysBtmFileType, should be provided with hh3cSysBtmRowStatus simultaneously in creation.

8) hh3cSysBtmErrorStatus can be used to get current progress or result of the updating operation. At any time, there is only one instance of which the hh3cSysBtmErrorStatus is 'InProgress' in the same device. Creating a new instance will fall into fail if there is an instance of which hh3cSysBtmErrorStatus is 'InProgress'.

9) If there is an attempt to remove the instance of which the hh3cSysBtmErrorStatus is 'InProgress', such attempt may fail.

The Boot Rom in BOOT ROM cannot be removed through hh3cSysBtmLoadTable, but it can be updated through this table.

When removing an instance from this table, there is no any deletion of the corresponding file in file system.

After updating a Bootrom file into BOOT ROM, the corresponding file can be removed from the file system, but it is not the responsibility of this table to remove a Bootrom file from the file system.

10) Please refer to the product guideline to make sure that the module supports updating.

#### ✧ Examples

Creating a new instance.

A valid Bootrom file named with "flash:/lsws5x308689\_v1.01.btw" is supposed existing in file system.

The entPhysicalIndex of the entity (the entPhysicalClass of this entity is 'module') is 2 (Here the value 2 is used just as illustration, the actual value must be got from entPhysicalIndex in entPhysicalTable of ENTITY-MIB), the customized randomIndex is 1. Then the value of hh3cSysBtmLoadIndex is 131073, and the value of the necessary objects should be set to:

hh3cSysBtmFileName.131073 = "flash:/lsws5x308689\_v1.01.btw"

hh3cSysBtmFileType.131073 = 'main'

hh3cSysBtmRowStatus.131073 = 'createAndGo'

## HH3C-TRNG2-MIB

This MIB is used to manage time-range.

When creating an absolute time-range, configure hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngAbsoluteNameIndex to create hh3cTrngAbsoluteTable.

When creating a periodic time-range, configure hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngPeriodicNameIndex to create hh3cTrngPeriodicTable.

If hh3cTrngCreateTimerangeTable is configured, hh3cTrngAbsoluteTable and hh3cTrngPeriodicTable are not configured, time-range does not actually exist, and the configuration of hh3cTrngCreateTimerangeTable may be lost after saving and rebooting, The configuration of hh3cTrngCreatTimerangeTable does not support the configuration replace operation.
